

# OBSTETRIC MRI: HOW WE DO IT IN SHEFFIELD

---

- **Debbie Jarvis, Senior Radiographer, Sheffield University MRI Unit**

The  
University  
Of  
Sheffield.

# OBSTETRIC MRI: A Practical Guide

---

- ❖ Patient Management and Care
- ❖ Placenta and Foetal MRI
- ❖ Scanning Technique
- ❖ Sequences Used

# BACKGROUND

---

- ❖ First Scans in 1998
- ❖ Number of scans increased from 3 to over 250 per annum

# Equipment

- ❖ GE 1.5T HDx Scanner
- ❖ 8 Channel HR Cardiac Coil

# PATIENT MANAGEMENT and CARE

---

- ❖ Appointment within 1 week unless clinically indicated otherwise
- ❖ Partners/Relatives included (at patient request)
- ❖ Safety forms completed and checked
- ❖ Feedback/Results given after scan
- ❖ Contact details given for further queries

# **PATIENT MANAGEMENT and CARE**

---

- ❖ Patient appropriately dressed
- ❖ Clear Explanation of Scan
- ❖ Patient into scanner Feet First either supine or on side
- ❖ Radiologist oversees scan

# SCAN TECHNIQUE: Foetal MRI

---

- ❖ True Anatomical Planes of Foetus Acquired
- ❖ Speed is Key
- ❖ Sequences not annotated, each a localiser for next

# SEQUENCES USED: Foetal MRI

---

- ❖ T2w Single Shot Fast Spin Echo
- ❖ FIESTA- T2w Balanced Gradient Echo
- ❖ T1w- Fast Gradient Echo/Spoiled GE
- ❖ FLAIR (brain only)
- ❖ Diffusion Weighted Imaging
- ❖ MOVIE

# Single Shot Fast Spin Echo

---

- ❖ Core MRI sequence
- ❖ Fast- 2 slices/3 seconds
- ❖ All 3 planes of Foetus
- ❖ 5mm and 3mm slice thickness, 0 Gap

# FIESTA

---

- ❖ Acquired in 3 planes, 5mm slices.
- ❖ Faster than SSFSE so less sensitive to movement
- ❖ High SNR and CNR

# T1- Fast Gradient Echo/Fast Spoiled Gradient Echo

---

- ❖ FGRE- Better Contrast for Brain- identifies possible bleed- Axial plane 5mm slices
- ❖ FSPGR- Better Contrast for Body- helps locate Liver/Bowel

# FLAIR and DWI

---

- ❖ Useful for identifying/clarifying abnormal signal in brain
- ❖ Brain DWI b-value 700, axial 5mm slices
- ❖ Body DWI b-value 500-axial 5mm slices-useful to locate kidneys

# MOVIE

---

- ❖ Multiphase, 45 Seconds to Acquire
- ❖ Asses Swallow/ Diaphragm movement

# MRI of the PLACENTA

---

- ❖ Recent increase in referrals
- ❖ Aim to determine any invasion and extent (Accreta/Percreta/Increta)
- ❖ Patients scanned at 32/40 weeks
- ❖ Scans Acquired using Anatomical planes of mother and full placental imaged.

# SEQUENCE DEVELOPMENT

---

- ❖ Sequence to identify key invasion signs which are:
  - ❖ - Dark intra-placental bands
  - ❖ - Uterine bulging
  - ❖ - Loss of heterogeneity of placenta signal
- ❖ Phantom constructed using belly pork and a recently delivered, donated placenta.

# SEQUENCES USED: Placenta MRI

---

- ❖ T2w SSFSE
- ❖ FIESTA
- ❖ T1 FGRE
- ❖ DWI

# Placenta SSFSE

---

- ❖ 5mm- Axial, Sagittal and Coronal
- ❖ 3mm- Axial and Sagittal
- ❖ identifies any dark intra-placental banding and assesses heterogeneity.

# Placenta: FIESTA

---

- ❖ 4mm slices- whole placenta in axial and sagittal planes.
- ❖ Delineates the placenta/myometrium borders, identifies uterine bulging
- ❖ Placenta becomes relatively featureless- banding or heterogeneity is lost.

# Placenta: T1 FGRE

---

- ❖ 5mm slices- axial and sagittal planes
- ❖ Identifies Haemorrhage and retro-placental bleeding

# Placenta DWI

---

- ❖ B value 1000 sec/mm<sup>2</sup>- placenta higher signal than myometrium
- ❖ 3 minute scan- Axial plane only

# Placenta Location

---

- ❖ 3mm slices parallel/perpendicular to birth canal

# THANKYOU
